Importance: High

Hi Paula,

Could you please authorize this rearch for an amendment which is due?

Thanks, Jennifer

STIC:

Please search SEQ ID NO: 1 and 2 for Serial No. 10/650,123 in pending and commercial

databases.

Thanks,

Jennifer Graser

similar to SW.RBN_ECOLI (EMBL:L19201), rbn, Escherichia similar to SW.RBN_ECOLI (EMBL:L19201), rbn, Escherichia coli ribonuclease BN (EC 3.1.-.-), fasta scores; E(): 2.3a-28, 34.3% identity in 268 as overlap. Longer than rbn at the C-terminus. Also similar to TR:08549

(EMBL:AF067083) Vitreoscilla sp. hypothetical protein (376 as), fasta scores; E(): 0, 45.0% identity in 333 as overlap. Contains a scores; E(): 0, 45.0% identity in 45 as overlap. Contains a hydrophobic, possible membrane-spanning regions,
                                                                                                                                                                                                                                                                                                                                                                                         /product="putative periplasmic protein"

A (NspA) from Neisseria meningitidis or Neisseria gonorrhoeae. The
invention also relates to the method of refolding an NspA protein; an
alkaline refolding buffer comprising ethanolamine and SB-12 (3dimethyldodecylammoniopropanesulphonate) for refolded NspA protein; a
pharmaceutical composition comprising the refolded NspA protein; a
carrier and optionally one or more other Neisserial antigens; a method of
preventing or treating a Neisserial infection; NspA has
corrier the NspA protein; and diagnosing a Neisserial infection. NspA has
characteristics which indicate that it is a potential vaccine candidate
for the development of subunit vaccines for the treatment of infections
caused by Neisseria meningitidis (meningococcus), which causes invasive
caused by Neisseria meningitidis (meningococcus), which causes invasive
caused by Neisseria meningitidis (meningococcus), which causes invasive
caused by Neisseria be used to produce vaccine compositions and it could
space the development of produce vaccine compositions and it could
also be used in the development of new antimicrobial agents, diagnostic
tests and in drug screening. However, recombinantly produced proteins are
frequently unable to adopt their biologically active conformations, and
yields may be very low due to mis-folding and aggregation of the protein.
The method of the invantion provides an improved method for refolding the
conformation and it is possible to increase the recovery of active protein form partly purified inclusion bodies in amounts up to 100% without the need for further purification. The refolded NspA protein is useful for preparing a composition for diagnosing, treating or preventing infection caused by Neisseria meningitidis or Neisseria gonorrhoeae. The 480 GTCGATTTTGGATGCCGGCTACGCTACATCGGCAAAGTCAAAGACCAAAAAC present sequence represents the NspA gene from Neisseria meningitidis New refolded NspA protein, useful for preparing a composition for diagnosing, treating or preventing infection caused by Neisseria meningitidis or Neisseria gonorrheae.

Composition comprising liposome associated with isolated polypeptide or polynucleotide derived from Neisseria meningitidis strain 608B, or its fragment or analog, useful for inducing an immune response against N.

The present invention relates to a pharmaceutical composition comprising a liposome associated with an isolated polypeptide derived from Neisseria meningitidis strain 608B, where the polypeptide is the Neph protein. The composition is useful for inducing an immune response against N meningitidis, for preventing and/or treating N. meningitidis infection and for treating and/or preventing neisserial infection chosen from N. meningitidis, N. gnorrhoaea, N. lactamica and N. polysacocharea. It is useful for treatment or prophylaxis of meningities and meningoccaemia, in a host. The host is a mammal, preferably a human and more preferably an adult human. The present sequence is the Neisseria meningitidis strain

A proteinase K resistant surface protein has been isolated from 4 strains of N. meningitidis (AAT39039 to AAT39042). The isolated 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect N. meningitidis antigen. DNA sequences encoding the antigen, or their fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Superantigen; ds; gene; SAq; staphylococcal enterotoxin; tumour; cancer; apoptosis; gene therapy; mammalian cell receptor; cytostatic; tumour associated lipid; anergy; T cell; antigen presenting cell; APC; tumouricidal immunocyte; antitumour.

WPI; 2003-361759/34. P-PSDB; ABU79079. A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis in T cells and antigen presenting cells.

Disclosure, Page, 167pp, English.

tree invention relates to a mammalian cell receptor, useful in the treatment of cancer, which binds to tumour associated lipids and induces anergy or apoptosis in the T cells and antigen presenting cells (APCs).

Also included are a mammalian cell useful in the treatment of cancer where the receptors which binds tumour associated lipids and induces cellular inactivation or death is debleted or functionally deactivated, producing (MI) a tumourcidal immunocyce population in vivo in a mammal producing (MI) a tumourcidal immunocyce population in vivo in a mammal (by allowing tumour associated lipids to context immunocyces in which creeptors for immunocyce and protecolycolipids, spuglosphingolipids, phosphosphingolipids, and and an animalian T cell settlement of cancer teratment of cancer comprising a superantisen (SAg) uncledied and inserted into a virus, a mammalian T cell settlement of cancer (where an adaptor protein which consistent in the treatment of cancer (where an adaptor protein which consistent in the treatment of cancer (comprising a lipid and composition useful in the treatment of cancer (comprising a lipid and composition and administering the tumouricidal limunocyce population are vivo in a mammal (by allowing tumour associated in immunocyce population and administering himmunocyce to produce a tumouricidal sumunocyce to produce a tumouricidal sumunocyce to produce a tumouricidal sumunocyce to the host, producing (WI) a tumour associated initiate and administering het unmouricidal summanal (by allowing a tumour associated lipids context cells, in which receptors for the tumour associated lipids to context T cells, and administering het unmouricidal population of a tumouricidal and an and and an and an antitumour associated antigens to context T cells of a tumouricidal T cell oppulation in vivo in a mammal (by allowing a tumouricidal T cell oppulation are uncontext in the present of administering and compositions are unequence and compositions are unequenced and compositions are unequenced and composi

                                                                                                          The invention describes a receptor in a mammalian cell that inhibits regular activation by receptors specific for lipid-based tumour associated antigen. The receptor has cytostatic and antimicrobial properties and is suitable for use in gene therapy. The receptors, methods and compositions are useful for treating a neoplastic disease or tumour (cancer), and infectious diseases. This sequence encodes Neisseria meningitidis lipopolysaccharide (LPS) to which tumour cells develop
                                                                                                                                                                                                                                                                                                                                                  202
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 322

The present invention describes the full length genome of Neisseria
meningitidis B (NMB). The sequences in AAF21544 and AAF21607 to AAF21613
CC represent fragments of the NMB genomic sequence, as the sequence was too
long to go in a record on its own it was split into 8 sequences which
co verlap each other at the beginning and end of each sequence by 49980 bp
(i.e. the last 49980 bp of AAF21541 is repeated at the beginning of
AAF21607, the last 49980 bp of AAF21507 are repeated at the beginning of
AAF21608, and so on). AAF21545 to AAF21589 encode the Neisseria proteins
CC AAF21608, and so on). AAF21545 and AAF21580 encode the Neisseria proteins
CC AAF21609, and so on). AAF21545 to AAF21580 encode the Neisseria proteins
CC AAF21609, and so on). AAF2164 is respeated at the beginning of
AAF21609, and so on). AAF2164 is respeated at the beginning of
CC AAF21609, and so on). AAF2164 is complification of the present invention.
CC AAF21609, and so on). AAF2164 is completed a city of the proteins and can
CC The NMB genome and fragments from it have antibacterial activity, and can
CC The NMB genome and gene therapy. Neisserial bacteria or as a
diagnostic reagent for detecting the presence of Neisserial bacteria or
CC antibodies raised to Neisserial bacteria.
CC antibodies raised to Neisserial bacteria or sed

The present invention relates to a new gram-negative bacterial bleb presenting on its surface the PorB outer membrane protein from Chlamydia trachomatis, or a protective antigen from C. pneumoniae. The invention is useful for preventing C. trachomatis or C. pneumoniae infection in a host. The present nucleic acid sequence represents a Neisseria gonorrhoeae gene as described in the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A proteinase K resistant surface protein has been isolated from 4 strains of N. meningitidis (AAT39039 to AAT39042). The isolated 22 kD antigen, antigent fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNA sequences encoding the antigen, or their fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)

A proteinase K resistant surface protein has been isolated from 4 strains of N. meningitidis (AAT39039 to AAT39042). The isolated 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNA sequences encoding the antigen or thair fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)

The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae linfection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABZ37706-ABZ42016 represent nucleic acid molecules of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A proteinase K resistant surface protein has been isolated from 4 strains of N. meningitidis (AAT39039 to AAT39042). The isolated 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNA sequences encoding the antigen, or their fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)

The invention relates to an insolated related with selection to the invention relates to the method of refolding an NspA protein; an invention also relates to the method of refolding an NspA protein; and invention also relates to the method of refolding an NspA protein; and dimethyldodecylammoniopropanegulphonate) for refolding an NspA protein, a dimethyldodecylammoniopropanegulphonate) for refolding an NspA protein, a carrier and optionally one or more other Neisserial antigens; a method of preventing or treating a Neisserial infection. NspA has contracteristics which indicate that it is a potential vaccine candidate for the development of subunit vaccines for the treatment of infections caused by Neisseria meningitidis (meningococcus), which causes invasive consed by Neisseria meningitidis (meningococcus), which causes invasive consed by Neisseria meningitidis (meningococcus), which causes invasive conservable development of genorathoea. Recombinantly produced conformations and it could also be used in the development of new antimicrobial agents, diagnostic tests and in drug screening. However, recombinantly produced proteins are frequently unable to adopt their blologically active conformations, and yields may be very low due to mis-folding and aggregation of the protein. The method of the invention provides an improved method for refolding the NSPA protein, and it is possible to increase the recovery of active protein form partly purified inclusion bodies in amounts up to 100% without the need for further purification. The refolded NsPA protein is useful for preparing a composition for diagnosing, treating or preventing cuseful for preparing a composition for diagnosing, treating or preventing infection caused by Neisseria meningitidis or Neisseria generation expense. The

Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABZ37706-ABZ42016 represent nucleic acid molecules of the invention TATTTCGGCGCGCGCTTGAGCCTCAACCGCGCTTCCGCCCACTTGGGCGGCAGCGACAGC GGTTCTGCCAAAGGCTTCAGCCCGCGCATCTCCGCAGGCTACCGCATCAACGACCTCCGC 486 GGTTCTGCCAAAGGCTTCAGCCCGCGTTCTCCGCAGGCTACCGCATCAACGACCTCCGC TTCGCCGTCGATTACACGCGCTACAAAACTATA---AAGCCCCATCCACCGATTTCAAA 3; Gaps Score 368; DB 10; Length 486; Pred.
